
Luis Rodríguez & Raul Di Blasio. 13, Solo. 14, La Gata Bajo La Lluvia - Raul Di Blasio con Rocio Durcal. 15, Luna De Paris.Q: How to configure proxy in grails command line? I have a grails app that I run under a Tomcat container using a command line executable. I have to connect to a proxy to access the internet. How can I configure this in the command line? A: In addition to ChrisW's suggestion to pass the proxy settings in the command line, you could also set the `http.proxy.host` and `http.proxy.port` properties in the same command line. If you wanted to use that in Grails, you would do: `grails http.proxy.host=proxy.host grails http.proxy.port=proxy.port` A: There is an extension for that. You can find it in [You need to set the environment variable http_proxy and the corresponding port http_proxy.port to your proxy server, and set the user and password for authentication.](#) UPDATE: Since 3.1 there is no longer need to use `grails http.proxy.host` and `http.proxy.port` but now the configuration is done in the `config.groovy`. In 3.1.x you can use: `proxy = { proxyHost = 'proxy.host' proxyPort = 'proxy.port' proxyUsername = 'user' proxyPassword = 'pass' }` A: To configure this in the command line, you need to set your environment variables: `export http_proxy=` Q: How to persist search terms when pressing enter on Google Sheets form? How do I persist a search term when pressing enter on a form? A: I created a function that saves the last formula in the spreadsheet to a "results.txt" file.
