Survivors of chronic childhood illness: the frailty of their everyday life. The aim of this article is to contribute to a literature that
seeks to understand the experience of life and living for children and young people living with long term health conditions. In
particular, the aim is to explore the sense of daily life for survivors of chronic illness. Taking the unique experiences of
childhood and long term health conditions into account, the study is exploratory and adopts an interpretivist approach. Based on
an interpretive phenomenological analysis of semi-structured interviews with 12 children and young people between the ages of
11 and 16 years living with a chronic condition, the article shows that a way of understanding living with a chronic health
condition is to consider the significance of the everyday life in an emotional way. This is done through an exploration of the
ways that survivors live and make sense of living a daily life in the presence of a chronic condition. The findings demonstrate
the significance of the everyday life in relation to the uncertainty and fragility of the chronic condition and the knowledge and
skills needed to cope with this. The analysis draws on a study of the concepts of being in limbo and struggling with multiple
roles, in the context of the everyday life. The findings provide an understanding of the complexities of living with a chronic
condition from the perspective of the participants and an indication of the challenges they face in creating and maintaining
'normal' lives. The findings demonstrate the significance of the everyday life in relation to the uncertainty and fragility of the
chronic condition and the knowledge and skills needed to cope with this. A single-chain antibody-enhanced, fluorescent DNA-
labeling assay for α -fetoprotein based on polyacrylamide-modified magnetic nanoparticles. α -fetoprotein (AFP) is a member of
